Training a Machine Learning Model with Lobe.ai

ASSIGNMENT 1

BH MNISI
STUDENT NUMBER:38431173

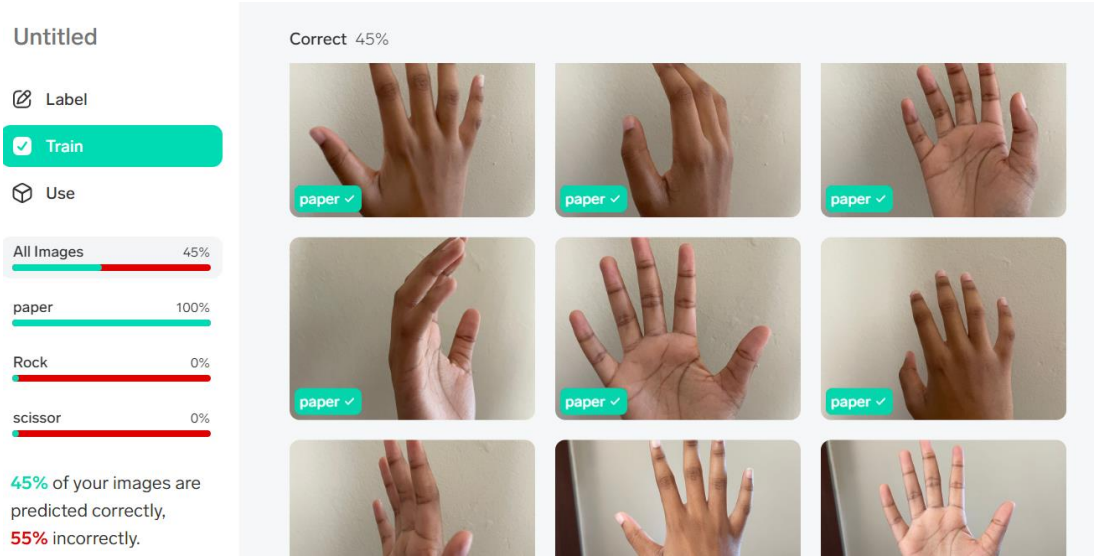
- Data collection process
  Describe the challenges and successes of gathering data:
  The app can't be installed in some laptops therefore has made it a bit difficult to work with, the application is tedious to work around as it has no deleting option when a mistake is made when importing a picture which forces the end user to start the a new. It is not efficient; at times you have to import pictures more before it responds. It takes long to train the data and it can't process all the data I uploaded, worst case sencenario is the is the data not being able to load for testing as seen below:

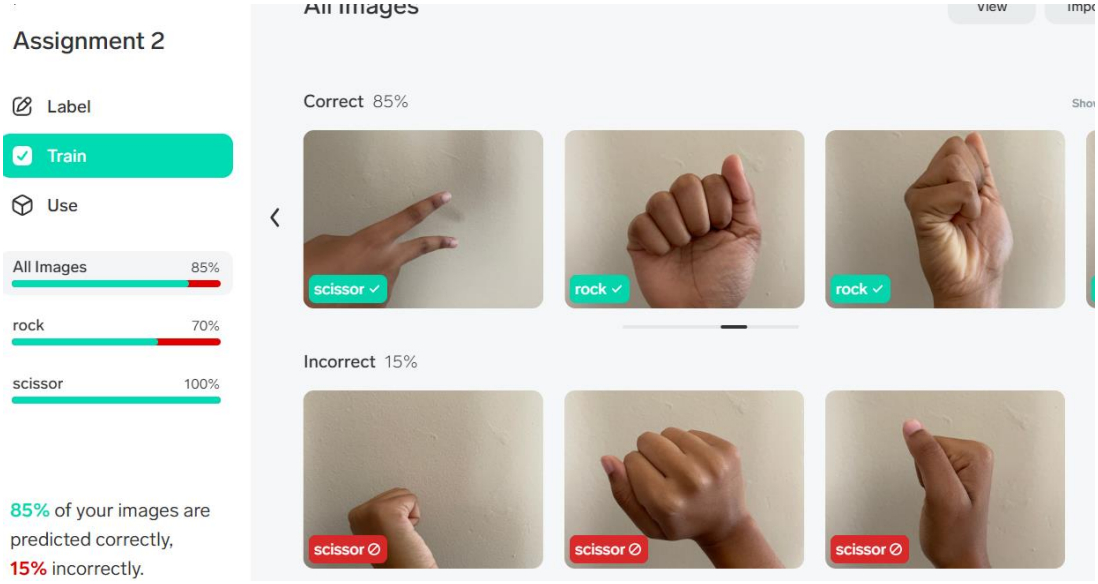
  For the duration of using this application I didn't experience any successes.

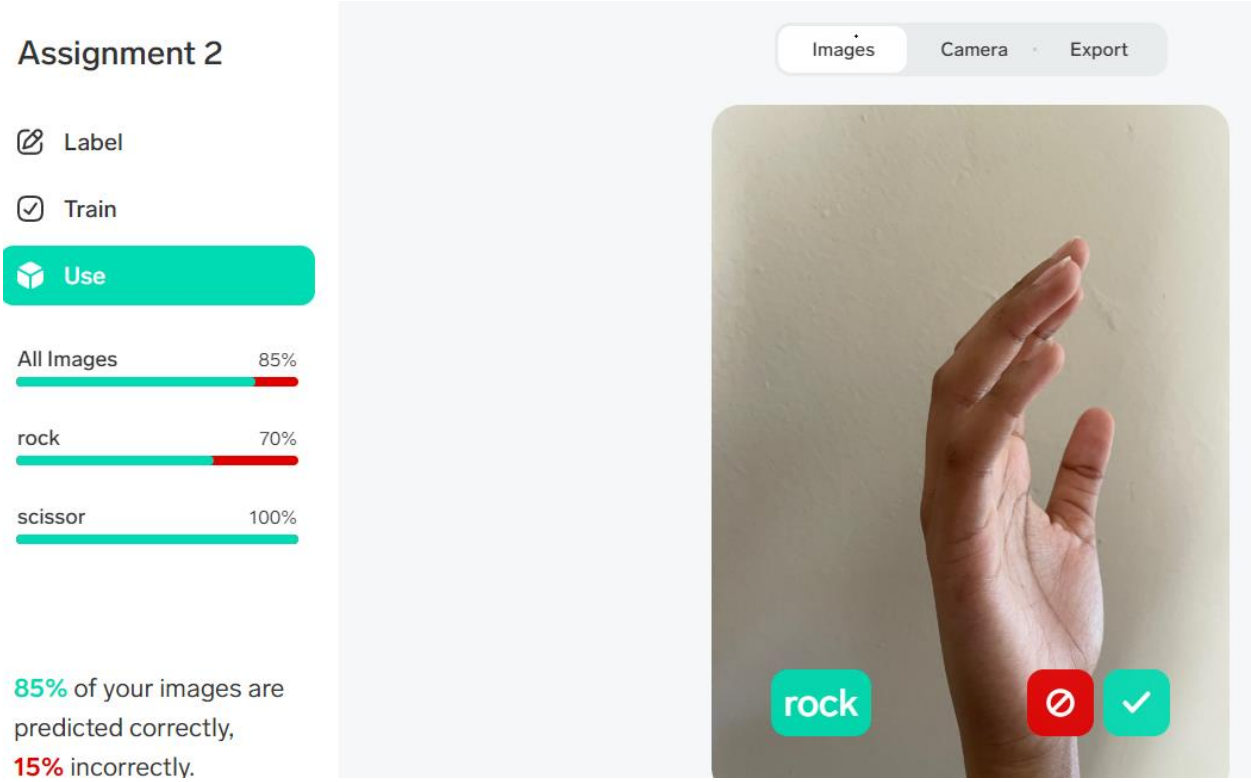
  Did the amount and diversity of data impact the model's performance:
  No, it didn't I uploaded 3 classes to be tested but each time I try to test the model the its either one class can't be detected and is seen as one of the other classes and when I removed the undetectable class the remaining classes worked better.

- Lobe.ai Experience
  Explain the ease of use and functionalities you found helpful in Lobe.ai:
  The examples found on the application help with navigating around the app as well as the helpful video you get from the website that illustrates how to use the app are great additions to the app. They assist the end user create and test their model via the visual illustration.

Mention any limitations or difficulties you encountered while using the platform:
The application crashed while using it, therefore was unable to process the data for testing. Not being able to store the model I have created is another limitation I encountered as I has to repeatedly do the same thing in order to get results and finally not being able to delete pictures that have been already imported is a problem because it forces the need user to delete everything and start all over.







- Learnings and Applications:
  Discuss your experience with using Lobe.ai comparison with Teachable Machines:
  Teachable Machines was such a breeze it was much better to manage than Lobe.ai, the testing phase with Teachable Machines was able to prepare all the uploaded data for testing even though it wasn't full accurate but it was good compared to Lobe.ai because it doesn't upload data all the data you have provided.

  Prose potential applications of your trained model and why it would be efficient:
  My trained model could potentially be adapted to help with sign language recognition, even though my model only involves 3 hand gestures which are relatively simple, it serves as a foundation to recognize and distinguishing various hand movements. Incorporating them into devices could make them more accessible to individuals who use sign language gestures for communication purposes.
